ELEC 342 Chapter 11 1 Chapter 11 Discrete Time Fourier Series and Transform Linear Algebra To begin with we will recall an idea from Linear algebra: Basis of vector spaces and change of co-ordinates. 1. Basis of vectors spaces. For a vector space say  $V$  (vectors of length  $N$  where the elements could be complex), a basis of  $V$  is a set of  $N$  vectors  $\{v_1, \dots, v_N\}$  such that any vector  $x \in V$  can be written as a linear combination of these vectors.

Mark A. Haidekkar, in Linear Feedback Controls, 2013. 11.7 Frequency Response of Digital Filters. In Chapters 4 and 9 Chapter 4 Chapter 9 we have introduced an interpretation of time-discrete control systems as digital filters. Both time-discrete feedback controls and digital filters are described by their z-transform transfer functions. If a time-discrete system with the transfer function  $H(z)$  is

Discrete-time signal is basically a sequence of numbers. Such signals arise naturally in inherently discrete-time situations such as population studies, amortization problems, national income models, and radar tracking. They may also arise as a result of sampling continuous-time signals in sampled data systems and digital filtering.

The basic discrete-time hazard model invokes assumptions about the population that may, or may not, hold in practice. This chapter examines its assumptions, demonstrating how to evaluate their tenability and relax their constraints when appropriate.
