Batch reactors contain ports for injecting reactants and removing products, and can be outfitted with a heat exchanger or a stirring system. While batch reactors are generally of constant volume, some are designed to maintain a constant pressure by varying the reactor volume.

Batch reactor - Wikipedia

By sizing a chemical reactor we mean we're either determining the reactor volume to achieve a given conversion or determine the conversion that can be achieved in a given reactor type and size. Here we will assume that we will be given $-r_A = f(X)$ and F_{A0} . In chapter 3 we show how to find $-r_A = f(X)$. Given $-r_A$ as a function of conversion, $-r_A$
