concept of this handbook. Satisfiability is the semantic version of consistency. A set of formulas is said to be satisfiable if there is some structure in which all its component formulas are true: that is,  $\{p_1, \dots, p_n\}$  is satisfiable if and only if, for some  $A$ ,  $A \models p_1$  and ...and  $A \models p_n$ . It follows from the definitions that

In mathematical logic, satisfiability and validity are elementary concepts of semantics. A formula is satisfiable if it is possible to find an interpretation that

makes the formula true. A formula is valid if all interpretations make the formula true. The opposites of these concepts are unsatisfiability and invalidity, that is, a formula is unsatisfiable if none of the interpretations make the formula true, and invalid if some such interpretation makes the formula false. These four concepts are

Boolean formula can be consistently replaced by the values TRUE or FALSE in such a way that the formula evaluates to TRUE. If this is the case, the formula is called satisfiable. On the other hand, if no such assignment exists, the function expressed by the formula is FALS
