Paramedics must perform a systematic assessment of the patient, determine appropriate treatment, and give it. While assessment and management principles are learned in initial training, they are not practiced until training is completed. Now, paramedic students can apply these principles with Medical Case Studies for the Paramedic. Medical Case Studies for the Paramedic presents 20 case studies on the most important medical emergencies for the ALS-level reader. A superb supplement to classroom and textbook learning, this book allows the reader to practice applying knowledge to cases before actually going on an emergency call. The types of emergencies include a range of presentations such as semiconsciousness, unconsciousness, difficulty breathing, weakness, nausea, headache, slurred speech, chest pain, allergic reaction, seizure, and anxiety. Each case study is presented in full, poses questions to the reader, and is followed by a summary of the case, including answers to the questions posed. The objectives for each of the case studies in this book are as follows: Describe the appropriate initial management based on initial assessment findings. Interpret the patient's cardiac rhythm, and determine if a correlation exists between the patient's condition and their cardiac rhythm. Formulate a field impression based on the patient's signs and symptoms, and findings of the focused history and physical examination. Determine if the patient's vital sign values and SAMPLE history findings are consistent with your field impression. Identify specific treatment that is required for the patient's condition. Determine if further treatment is required following a post-treatment reassessment of the patient. Based on the patient's condition, identify any special considerations for care.

100 Cases in Clinical Medicine is an indispensable revision tool for medical students preparing for clinical examinations or OSCEs. Using scenarios which mimic daily life, the cases will interest students in clinical problems and help them develop their clinical reasoning skills, with each case presenting details of a patient's medical history and the key findings of a clinical examination, together with initial investigation results for evaluation. Key questions then prompt the student to evaluate the patient, and reach a decision regarding their condition and the possible management plan, while the answer pages will help the student to understand the processes that a clinician goes through in dealing with the problems presented. Contents are organised to provide a quick review of each body system, with a selection of cases relevant to that specific system, then the majority are presented randomly to mimic real life in a GP surgery or emergency department. New to this edition: a review of each body system as well as random cases; new page design with a second colour used throughout; and brought up-to-date with 25% new cases.
