The Sussexes have hired a producer for their Archewell Audio podcast, following growing questions about when they would release a new episode as part of their reported \$25 million Spotify deal.

This issue of Clinics in Sports Medicine focuses on athletic injuries in the military population. The young, active individuals participate in a wide range of athletic and military activities that results in high injury rates as well as extreme performance demands. Military sports medicine physicians have provided many advances in the care of athletic injuries in the past and continue to pursue this today.

Field Manual (FM) 3-34.400, "General Engineering," is the primary implementing manual for the engineer function that bears its name (the others being combat and geospatial engineering). This manual provides general engineering (GE) doctrine for the United States (U.S.) Army and U.S. Marine Corps. As the implementing manual for the engineer function of general engineering (GE), FM 3-34.400 describes the operational environment (OE) and how to apply and integrate GE principles in support of full spectrum operations and the linkage of GE to assured mobility. This FM focuses on the establishment and maintenance of lines of communications (LOCs) and sustainment operations that support operational requirements throughout the area of operations (AO). FM 3-34.400 is designed primarily to assist Army engineers at all echelons in planning and coordinating GE operations at the strategic, operational, and tactical levels. It is also a resource applicable to Department of Defense (DOD), joint, and other Army organizations and agencies that have a role in supporting, establishing, and/or maintaining the infrastructure required to conduct and sustain military operations. It is the primary manual to define the engineer function of GE. FM 3-34.400 is applicable across full spectrum operations. This includes the four types of Army operations (offense, defense, stability, and/or civil support) across the spectrum of conflict (peace, crisis, and war). This FM recognizes the need for joint interdependence and the reality that operations will frequently be performed in a joint, interagency, and multinational environment.

This issue of Nursing Clinics of North America, Guest Edited by Sharon Stark, PhD, RN, APN-C, will focus on Victims of Abuse, with topics including: Types of Abuse ; Interpersonal Violence; Child Abuse; Elder Abuse; Bullying; Substance Abuse and Violence; Domestic Violence; Abuse in Nursing Homes; Nurses as Victims of Abuse; Issues of abuse in military deployment and military families; Abusive Behavior in the Workplace; The Relationship Between Abuse and Depression; Meeting the 2015 Millennium Development Goals With New Interventions for Abused Women; Community Services/Prevention; and Educational Considerations.

Posttraumatic stress disorder (PTSD) is one of the signature injuries of the U.S. conflicts in Afghanistan and Iraq, but it affects veterans of all eras. It is estimated that 7-20% of service members and veterans who served in Operation Enduring Freedom and Operation Iraqi Freedom may have the disorder. PTSD is characterized by a combination of mental health symptoms - re-experiencing of a traumatic event, avoidance of trauma-associated stimuli, adverse alterations in thoughts and mood, and hyperarousal - that last at least 1 month and impair functioning. PTSD can be lifelong and pervade all aspects of a service member's or veteran's life, including mental and physical health, family and social relationships, and employment. It is often concurrent with other health problems, such as depression, traumatic brain injury, chronic pain, substance abuse disorder, and intimate partner violence. The Department of Defense (DoD) and the Department of Veterans Affairs (VA) provide a spectrum of programs and services to screen for, diagnose, treat for, and rehabilitate service members and veterans who have or are at risk for PTSD. The 2010 National Defense Authorization Act asked the Institute of Medicine to assess those PTSD programs and services in two phases. The Phase 1 study, Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations: Initial Assessment, focused on data gathering. Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations Final Assessment is the report of the second phase of the study. This report analyzes the data received in Phase 1 specifically to determine the rates of success for each program or method. Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations Final Assessment considers what a successful PTSD management system is and whether and how such a system is being implemented by DoD and VA. This includes an assessment of what care is given and to whom, how effectiveness is measured, what types of mental health care providers are available, what influences whether a service member or veteran seeks care, and what are the costs associated with that care. This report focuses on the opportunities and challenges that DoD and VA face in developing, implementing, and evaluating services and programs in the context of achieving a high-performing system to care for service members and veterans who have PTSD. The report also identifies where gaps or new emphases might be addressed to improve prevention of, screening for, diagnosis of, and treatment and rehabilitation for the disorder. The findings and recommendations of Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations: Final Assessment will encourage DoD and VA to increase their efforts in moving toward a high-performing, comprehensive, integrated PTSD management strategy that addresses the needs of current and future service members, veterans, and their families.
